

DATA ANALYTICS & BUSINESS INTELLIGENCE

Zomato Sales Dashboard

An interactive dashboard built to turn a year of food-delivery order data into clear, decision-ready insight.

Project Report

Prepared July 2026

1. Executive Summary

A hundred thousand orders, one dashboard, and a much clearer picture of what's actually selling.

This report walks through a Zomato-style sales dashboard built in Power BI, covering food-delivery order records across Indian states, five product categories, and a base of fifty thousand customers. Rather than leaving the numbers buried in transaction logs, the dashboard organizes them into KPI cards, charts, a geographic map, and interactive filters so that a category manager or operations lead can ask a question — "which state is driving the most orders?" or "is Rasmalai really our best-seller?" — and get an answer in seconds, not hours.

The headline numbers: Rs. 121M in total revenue, 100K total orders, 50K customers, an average order value of Rs. 1.2K, and 70K orders successfully delivered. Rasmalai and Sandwich are the runaway top products by revenue, Beverage and Fast Food lead the category mix, and monthly sales hold a tight, largely stable band across the year with a dip in February and a peak in May. The sections below unpack how the dashboard reaches these conclusions and what they suggest for action.

2. Project Overview & Objectives

The Zomato Sales Dashboard was built to make a large, order-level food-delivery dataset usable at a glance. Raw order rows rarely tell a story on their own — it takes structure, visualization, and the ability to slice the data by state, category, order status, and month before patterns start to emerge. That's exactly what this dashboard does: it takes revenue, order, and product-level records and reorganizes them into a format where geographic spread, category performance, and monthly trends become visible immediately.

The project was guided by a few clear goals:

- Give a real-time, at-a-glance view of overall order volume and revenue
- Track delivered orders separately from total orders, since fulfillment matters as much as demand
- Pinpoint which states are generating the most orders on the map
- Identify the top-selling products and categories driving revenue
- Surface month-to-month sales trends rather than just year-end totals
- Let users explore freely by state, category, order status, and month through slicers, without ever touching or risking the underlying data

3. Tools & Dashboard Features

Everything here was built natively in Power BI, using Power Query for data cleaning and shaping, DAX for calculated measures, and native data modeling to connect order, product, and location tables into a single analytical model. A dark, high-contrast visual theme with a red accent keeps the KPI cards and charts easy to scan at a glance.

Interactive Filters

Four slicers sit on the left-hand side of the dashboard — State, Category, Order Status, and Month — and can be combined freely, with a one-click Reset Filters button to return to the full unfiltered view. Selecting any combination instantly refreshes every KPI card and chart on the page.

KPI Cards

Five icon-led cards anchor the top of the dashboard: Total Revenue, Total Orders, Customers, Order Value, and Delivered Orders — designed to answer the first question anyone asks — "how big is the business, and how much of it actually got delivered?" — before a single chart is read.

Visualizations

The dashboard combines a geographic map (orders by state), a horizontal bar chart (Top 5 Products by revenue), a donut chart (Total Orders by Category), and an area chart (Total Sales by Month) — each chosen to answer a specific business question rather than for visual variety alone.

4. Walkthrough of the Dashboard

The clearest way to understand what this dashboard can do is to look at it in action — the view below shows the full, unfiltered dataset.

4.1 Sales Overview — Full Dataset, No Filters Applied

The unfiltered master view — every order, every state, every category, all at once.

This is the dashboard at rest, showing the complete order dataset. Of the 100K total orders placed, 70K were successfully delivered — a 70% delivery-completion rate, which leaves 30K orders that were cancelled, pending, or otherwise not completed and worth investigating further. Average order value sits at Rs. 1.2K, and with 50K customers on record, that works out to an average of two orders per customer over the period covered.

The state map shows demand concentrated around major metros and northern India, with Delhi and surrounding states carrying a visibly denser cluster of markers than the south or northeast. On the product side, **Rasmalai** is the clear top seller at Rs. 7.4M, ahead of Sandwich (Rs. 6.6M) and Pizza (Rs. 3.5M); Spring Roll and Waffle round out the top five at Rs. 2.1M and Rs. 2.0M respectively — a top-heavy list where the leading two products outsell the bottom two combined. By category, **Beverage** (27K orders) and **Fast Food** (26K orders) together account for more than half of all order volume, with Indian (14K), Chinese (16K), and Dessert (17K) making up the rest.

Month to month, total sales hold a tight, stable band roughly between Rs. 9.3M and Rs. 10.5M, with February the weakest month and May the strongest — a pattern that points to mild seasonality rather than one dramatic high- or low-demand window. The narrow spread across the year suggests the business has a fairly predictable, non-seasonal demand base overall.

5. Chart Reference Guide

For quick reference, here's what each visualization on the dashboard is built to answer:

Chart	What it answers
State Map	Which states and regions are generating the most orders
Top 5 Product	Which individual products contribute the most to revenue
Total Orders by Category	How order volume splits across Beverage, Fast Food, Dessert, Chinese, and Indian
Total Sales by Month	Whether revenue is seasonal or holds steady across the year
KPI Cards (Revenue / Orders / Customers / Order Value / Delivered)	The core at-a-glance health metrics of the business

6. Key Insights & Recommendations

Pulling everything together, a few findings come through clearly:

- Delivery completion sits at 70% — the remaining 30K orders that weren't delivered represent a meaningful volume worth breaking down by cancellation reason and state.
- Product revenue is top-heavy: Rasmalai and Sandwich alone account for roughly 46% of the Top-5 product revenue, making them the clear priority for inventory and supply-chain reliability.
- Beverage and Fast Food dominate order volume, together accounting for more than half of all orders — a strong signal for where kitchen capacity and delivery-partner allocation should be concentrated.
- Demand is geographically concentrated, with a visibly denser cluster of orders around Delhi and northern India than in the south or northeast, pointing to an opportunity for targeted expansion.
- Monthly sales are stable with mild seasonality (low in February, peak in May), suggesting demand-planning can rely on a fairly predictable baseline rather than sharp seasonal swings.

Based on these patterns, a few practical next steps are worth considering: investigate the 30% of orders that aren't marked delivered to reduce cancellations or fulfillment failures; protect supply and delivery-partner capacity for Rasmalai and Sandwich given their outsized revenue share; and explore targeted marketing or dark-store expansion in states outside the current northern concentration to diversify the order base.

7. Closing Thoughts

What this project really demonstrates is that Power BI, used well, can turn a flat set of order-level transaction logs into something a business can actually interrogate — filter it by state, category, or month, and trust the

answer that comes back. With interactive slicers, icon-led KPI cards, and a consistent dark visual theme across a single, dense page, raw delivery data becomes a genuine decision-support tool rather than a static report.

This dashboard is offered as a working example of that idea — practical, interactive, and built to support real conversations about revenue, demand, and delivery performance, not just report on the past.
